

# Holy Beef Combos Batman!

Challenges and Solutions Dealing with  
Industrial Scale Food Safety Research

# Kansas State University's Biosecurity Research Institute (BRI)

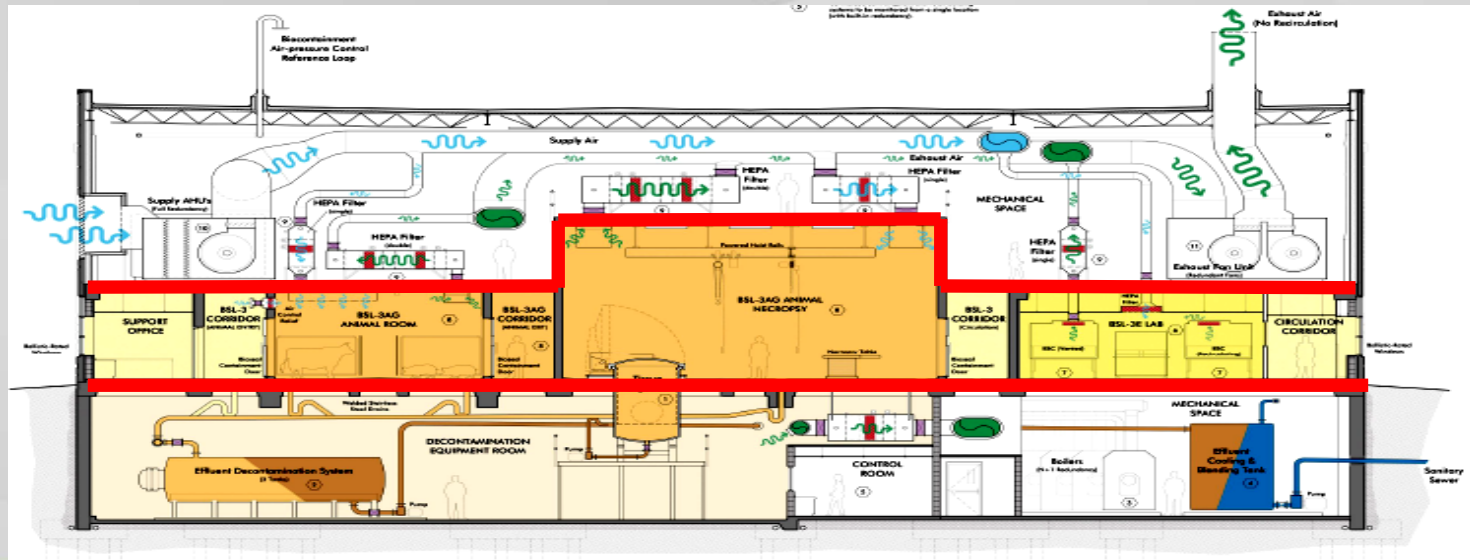

# State-of-the-Art BSL-3 & BSL-3Ag Facility

Mechanical space  
(air handling)

Laboratory &  
Administration

Mechanical Space  
(waste treatment)

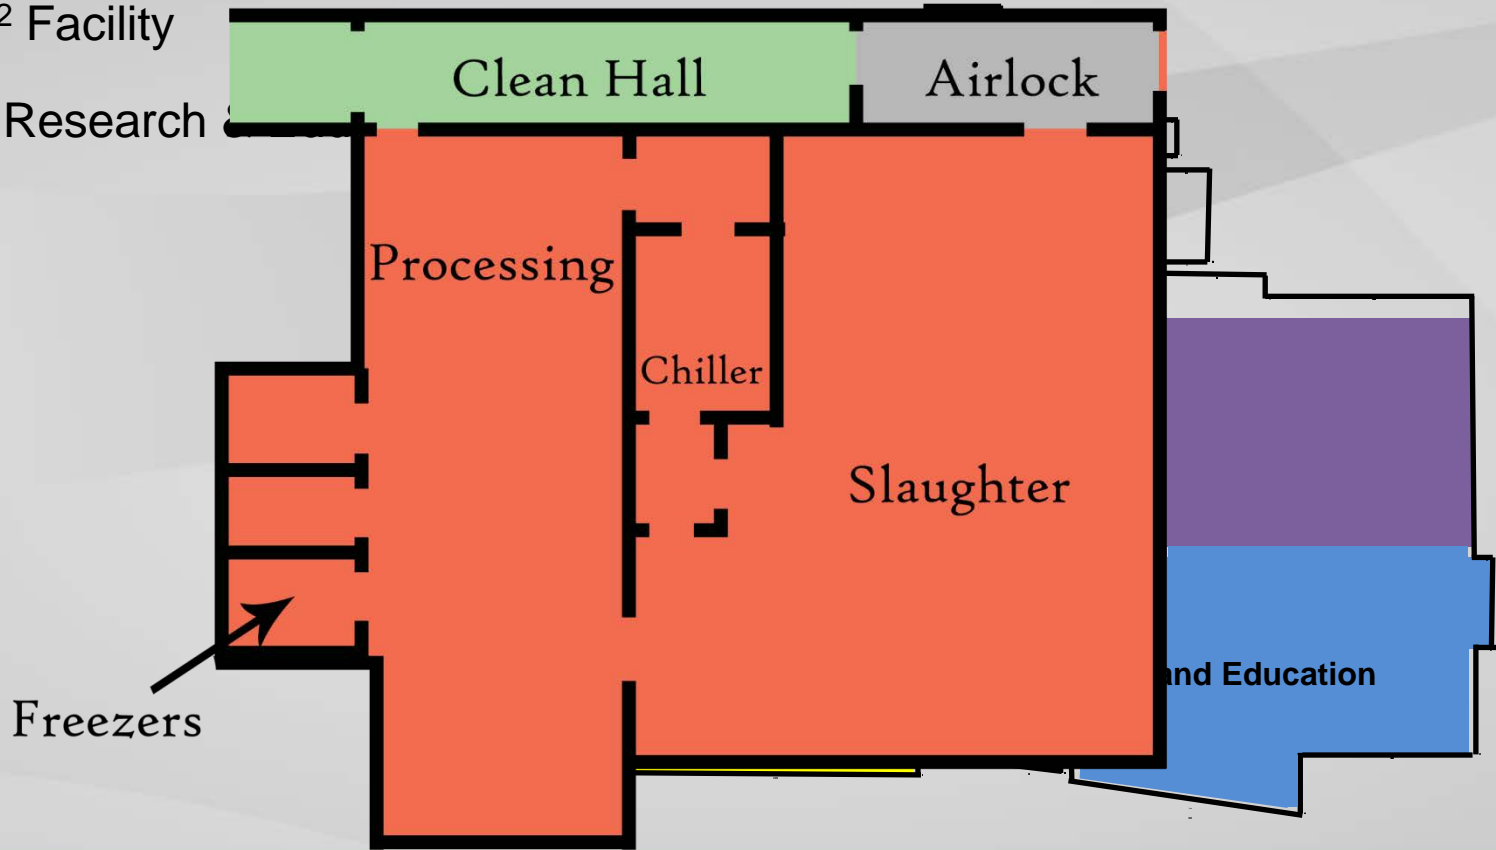

113,000 ft<sup>2</sup> Facility

41,000 ft<sup>2</sup> Research & Education Space

113,000 ft<sup>2</sup> Facility

41,000 ft<sup>2</sup> Research

# Unique Slaughter/Food Processing Floor

- USDA style layout
- Operate at BSL-2 or BSL-3

# Food Processing Floor

- Flexible floor configuration
- 17,769 ft<sup>2</sup> allows for industry scale food projects
  - 2 walk-in coolers
  - 1 walk-in freezer
    - 630 ft<sup>2</sup>

# The bioBUBBLE

- Installed bioBUBBLE for “Big Grind I & II”

# Personal Protective Equipment

- Tyvek coveralls
- Two pair of gloves
- Hard hat PAPRs
- Steel toe boots
- Ear plugs

# Big Grind I: STEC

- Performed 5 runs/grinds
  - 1 per week
- Each run required 2 combos
  - 2 combos = 4000 lbs.
- Total amount of inoculated ground beef trim = 20,000 lbs.

# Big Grind I: STEC

- Run 1: Practice, no infectious agent used
- Run 2-4: Used various serotypes of *E. coli*
- Run 5: Combo sampling with *E. coli* (no grinding)

# Big Grind I: STEC

- Runs 2-4 had 3 separate inoculation events with various serotypes of *E. coli*

# Big Grind I: STEC

- Run 5 had one inoculation event
- A piece of STEC inoculated beef trim was randomly placed in the combo

# Big Grind II: BA Sterne

- Performed 3 runs/grinds
  - 1 per week
- Each run required 2 combos
  - 2 combos = 4000 lbs.
- Total amount of inoculated ground beef trim = 12,000 lbs.

# Big Grind II: BA Sterne

- All 3 runs inoculated with *Bacillus anthracis* Sterne spores
- One inoculation event
  - Inoculated beef trim put into the grinder

To the Digester!

How are we going to  
get rid of 32,000 lbs. of  
inoculated meat?

# Alkaline Tissue Digester

- Normally used to dispose of animal carcasses
- Located in necropsy
- 5,000 lb. capacity

# Alkaline Tissue Digester

- Denatures carcasses into amino acids, lipids, sugars, and minerals through
  - Steam
  - Heat
  - Pressure
  - High pH (KOH pH13)

# Known Limiting Factors for the Digester

# Known Limiting Factors for the Digester

- Releasing the material
  - MOU with the City of Manhattan
  - Coordinate with Veterinary College
  - If releasing on Friday must provide notification

# How We Assumed it Was Going to Work!

# 55 Gallon Barrels!

- Load inoculated meat into the barrels
- Place lids on barrels to seal
- Barrels have wheels

# Decontaminate the Barrels

- Use the foamer to decontaminate the outside of the barrels

# Move Barrels from Processing to Necropsy

# Dump the Barrels into the Digester

# The Process Did Not Go Quite as Planned

# Red Barrels

- Lids did not stay on
- Solution
  - Shrink wrap!

# Processed Meat = Lots of Fat & Grease

- Fat and grease got stuck everywhere
- Solution
  - Spray everything down with 180°F water
  - All liquid waste goes to the EDS

# A Lot of Meat

- Once filled, each barrel weighed 400-450 lbs.
- Solution
  - use the barrel dump to empty into the digester

# More Fat & Grease

- Meat left behind greasy residue
  - Hard to clean barrels
- Solution
  - Lined barrels with digestible bags
    - used 2 layers for strength

# Barrel Storage

- Found out we could not run the digester at full capacity
- Solution
  - Store the barrels
  - 3 walk-in coolers and 1 walk-in freezer came in handy

# Digester Issues

- First digester run
  - Standard cycle
  - 4000 lbs. of processed meat
- Material solidified
  - Major issues trying to release material

# Digester Issues

- 4000 lbs. of meat  $\neq$  4000 lbs. of animal carcass
  - Processed meat has a lot more fat than animal carcasses

# Digester Solutions

- Drastically reduce the amount of processed meat loaded into the digester
  - 1000-1500 lbs. processed meat compared to 5000 lbs. of animal carcass
  - Consulted with service contractor regarding cycle modifications

# Digester Solutions

- Change the chemical recipe
  - Animal carcass recipe = 150% H<sub>2</sub>O + 20% KOH
  - Processed meat recipe = 200% H<sub>2</sub>O + 26% KOH

# Digester Solutions

- Additional steps needed before release was possible
  - Add more H<sub>2</sub>O to dilute the mixture even further
  - Re-heat the digester to get the mixture back in a liquid form so it could be released
    - Normal flow to city waste treatment plant

# Fun Fact

- Mixing animal carcasses with processed meat helped keep contents from solidifying

# Fun Fact

- Filled ~75 red 55 gallon barrels

# Fun Fact

- Digested ~32,000 lbs. of inoculated processed meat

# Fun Fact

- It took 16 digester runs over one year to dispose of all the processed meat

# Conclusion

- Lots of pre-planning was crucial to get this project up and running
- Creative thinking and innovation was a necessity to keep this project flowing
